

Car Resale Value Prediction

Introduction:

Predicting the price of used cars is both an important and interesting problem. With difficult economic conditions, it is likely that sales of second-hand imported (reconditioned) cars and used cars will increase. In many developed countries, it is common to lease a car rather than buying it outright. After the lease period is over, the buyer has the possibility to buy the car at its residual value, i.e. its expected resale value. Thus, it is of commercial interest to sellers/financers to be able to predict the salvage value (residual value) of cars with accuracy.

If the residual value is under-estimated by the seller/financer at the beginning, the installments will be higher for the clients who will certainly then opt for another seller/financer. If the residual value is over-estimated, the installments will be lower for the clients but then the seller/financer may have much difficulty at selling these high-priced used cars at this over-estimated residual value. Thus, we can see that estimating the price of used cars is of very high commercial importance as well.

Overview:

Predicting the resale value of a car is not a simple task. It is trite knowledge that the value of used cars depends on a number of factors. The most important ones are usually the age of the car, its make (and model), the origin of the car (the original country of the manufacturer), its mileage (the number of kilometers it has run) and its horsepower. Due to rising fuel prices, fuel economy is also of prime importance. Some special factors such as whether the car had been involved in serious accidents might play a major role in estimating the price. The look and feel of the car certainly contributes a lot to the price. As we can see, the price depends on a large number of factors. Unfortunately, information about all these factors are not always available and the buyer must make the decision to purchase at a certain price based on few factors only.

Purpose:

In order to predict the resale value of the car, we proposed an intelligent, flexible, and effective system that is based on using regression algorithms. Considering the main factors which would affect the resale value of a vehicle a regression model is to be built that would give the nearest resale value of the vehicle. We will be using various regression algorithms and algorithm with the best accuracy will be taken as a solution, then it will be integrated to the web-based application where the user is notified with the status of his product and the predicted resale value will be displayed.

Proposed Solution:

Pre-Process the Data -

Preprocessing includes:

1. Handling the null values.
2. Handling the categorical values if any.
3. Normalize the data if required.
4. Identify the dependent and independent variables.
5. Split the dataset into train and test sets.

Model Building -

There are several Machine learning algorithms to be used depending on the data such as images, sound, text, and numerical values. The algorithms can be chosen according to the objective. As the dataset which we are using is a Regression dataset so you can use the following algorithms

- Multi Linear Regression
- Random Forest Regression / Classification
- Decision Tree Regression / Classification
- K-Nearest Neighbors
- Support Vector Machine

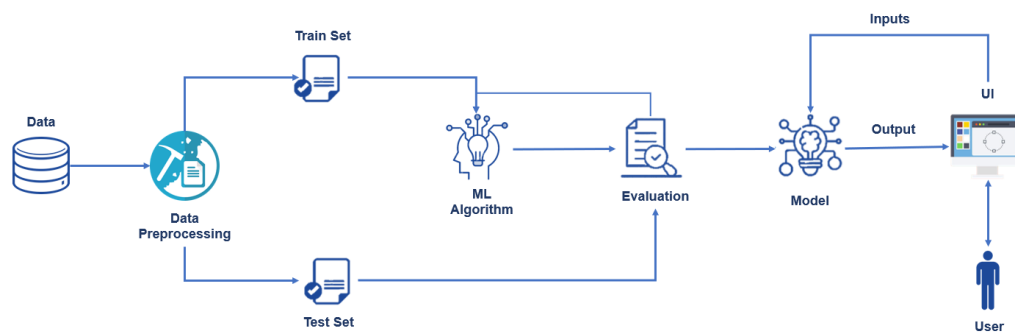

Then train the datasets to run smoothly and see an incremental improvement in the prediction rate.

The Appropriate Model

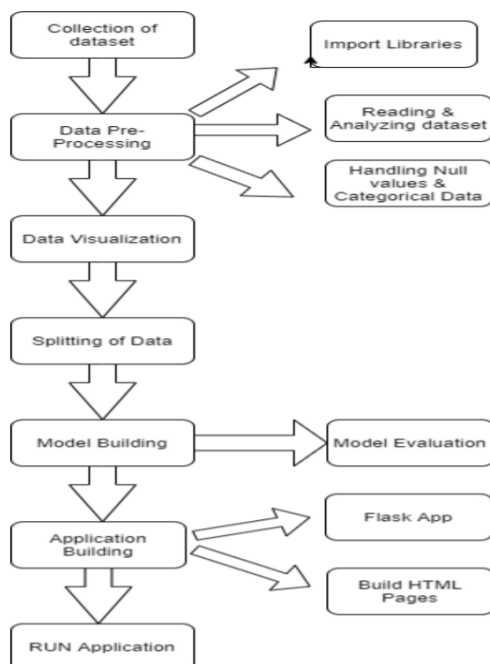

Considering the accuracy, Random Forest Regression is the appropriate model. A Random Forest is an ensemble technique capable of performing both regression and classification tasks with the use of multiple decision trees and a technique called Bootstrap and Aggregation, commonly known as bagging.

Result:

The screenshot shows the same web browser window, but now displaying a form titled "Please fill the following details of your car:". The form contains several input fields for car details, including Registration Year, Registration Month, Power of car in PS, Kilometers the car has driven, Gear Box Type, Your car is damaged or repaired, Model Type, Brand of the car, Fuel type of the car, and Vehicle type. Each field has a corresponding input type (text, dropdown, or radio button). At the bottom of the form, there is a button labeled "PREDICT". The browser's taskbar at the bottom shows various icons and the system clock indicating 17:59 on 18-07-2021.

Get the Accurate Resale Value of your Car!!

Please fill the following details of your car:

Registration Year: 2001

Registration Month: January

Power of car in PS: 234

Kilometers the car has driven: 2000

Gear Box Type: ☐ Manual ☒ Automatic ☐ Not declared

Your car is damaged or repaired: ☒ Yes ☐ No ☐ Not declared

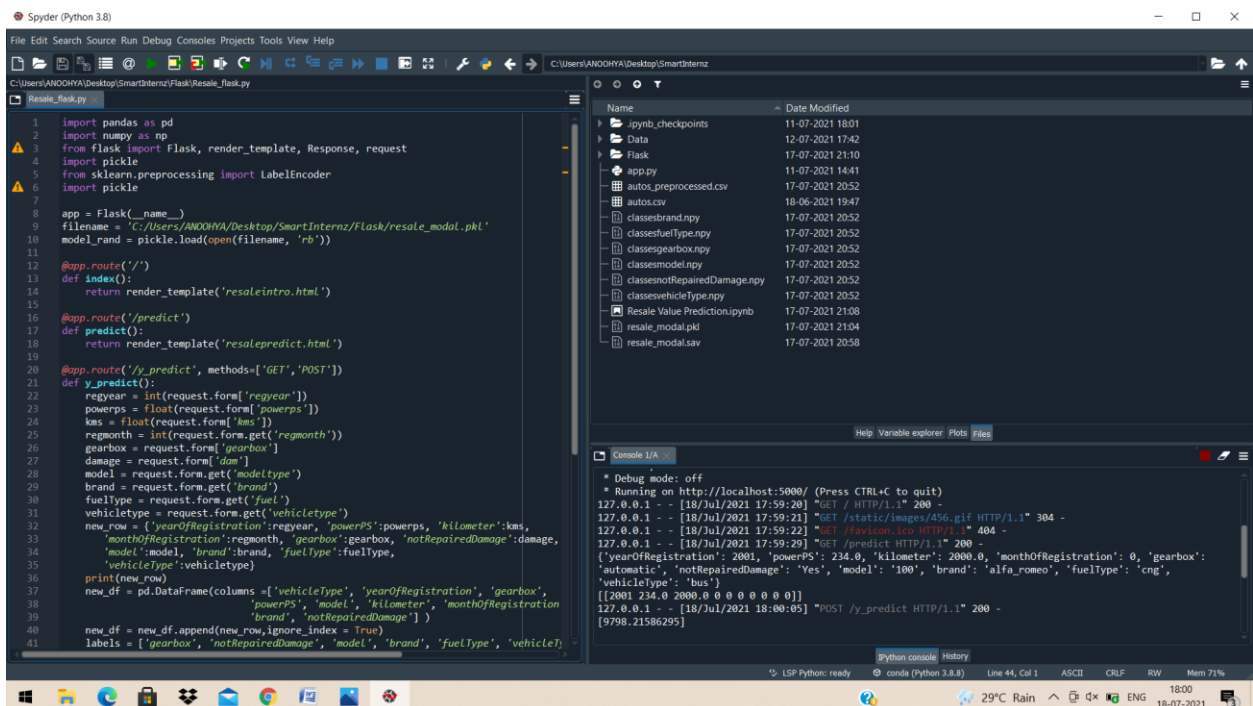

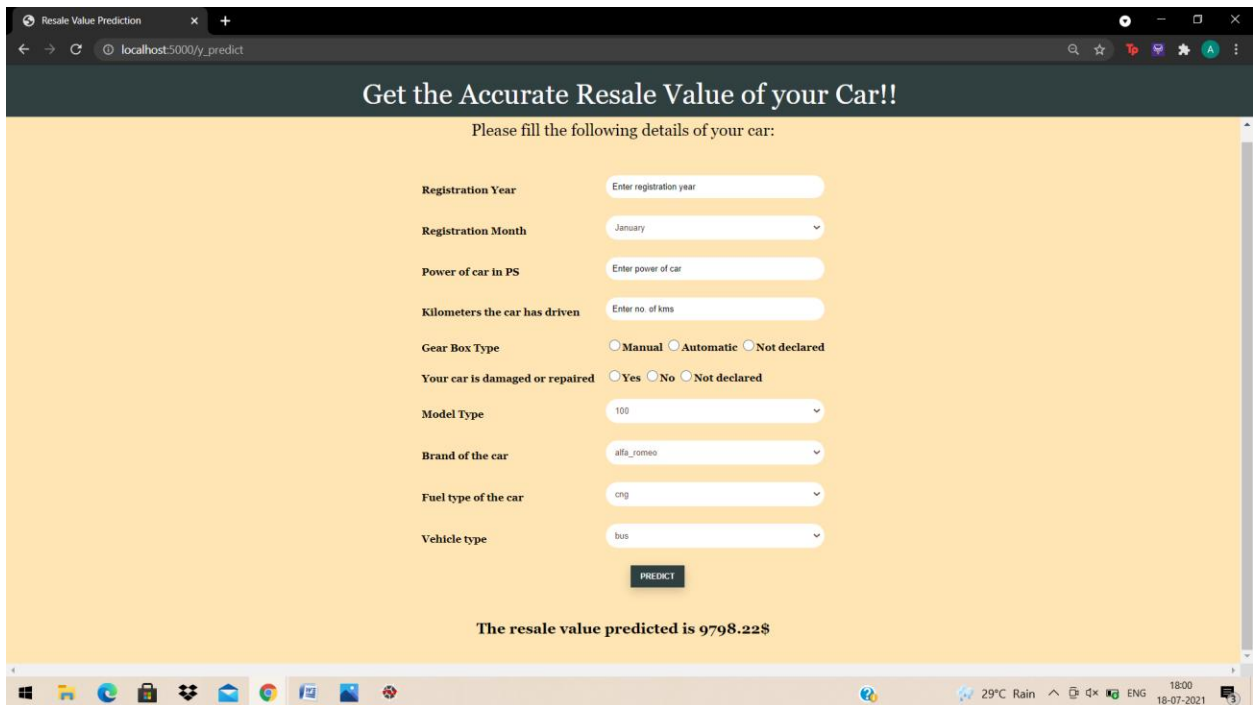

Model Type: 100

Brand of the car: alfa_romeo

Fuel type of the car: cng

Vehicle type: bus

PREDICT

For the dataset, using Random Forest Regression model has given an accuracy of 83% for the prediction.
